North American emissions compliance

United States

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:

- Reorient or relocate the receiving antenna.
- Increase the separation between the equipment and receiver.
- Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
- Consult the dealer or an experienced radio/TV technician for help.

For wireless models, also locate the thermostat controller:

- Outside of a recessed area, metal enclosure, or shelving unit
- On the same building level as the other wireless devices on the same personal area network (PAN)
- At least 2 in. (51 mm) away from any metal obstruction
- In the direct line of sight to other wireless devices on the same PAN. Signal transmission is best if the path between the TEC3000 and other wireless devices is direct as possible. Line of sight is desirable but not required. See Table 1 for recommended and maximum distances.
- Away from metal and large solid obstructions (including equipment rooms and elevator shafts and concrete or brick walls) between the TEC3000 and the ZFR Pro Router/Repeater or ZFR Pro Coordinator Radio
- Within range of two or more wireless devices on the same PAN. Redundancy in the layout provides the best reliability in wireless installations
- At least 20 ft (6 m) from a microwave oven

For integrated passive infrared (PIR) models, be sure that the thermostat controller is located centrally, where occupant movement is frequent. Ensure that the unit is not blocked by a plastic tamper resistant enclosure (such as the GRD10A-608). The plastic enclosure blocks the occupancy sensing capability.

The use of insulating foam pads is required for installations where wiring passes through the wall to the thermostat.

For wireless models, the effective transmission range and distance for indoor applications vary because of wireless signal absorption and reflection due to metal obstructions, walls or floors, and furniture found in typical building interiors.

Location considerations

For networked models, locate the TEC3000 Series Thermostat Controller:

- On a partitioning wall, approximately 5 ft (1.5 m) above the floor in a location of average temperature, allowing for vertical air circulation to the TEC
- Away from direct sunlight, radiant heat, outside walls, outside doors, air discharge grills, stairwells, and from behind doors
- Away from steam or water pipes, warm air stacks, unconditioned areas (not heated or cooled), or sources of electrical interference
- In a clear path between the integrated passive infrared (PIR) occupancy sensor (if equipped) and the space being monitored

Notes:
- Allow for sufficient clearance to insert a USB drive into the USB port
- For more details on using ZFR Pro Series communication devices, refer to the WNC1800/ZFR182x Pro Series Wireless Field Bus System Technical Bulletin (LIT-12012356).

**Important:** Only connect memory devices to the USB port. Do not use it for charging external devices.

Figure 1: Thermostat controller shown without occupancy sensor, dimensions, in. (mm)

Installing the thermostat controller

1. Use a 1/16 in. (1.5 mm) Allen wrench or Johnson Controls® T-4000-119 Allen-Head Adjustment Tool (order separately) to remove the security screw if it is installed on the top of the thermostat controller cover as illustrated in Figure 2.

2. Pull the top edge of the cover and open the thermostat controller as illustrated in Figure 2.

**Important:** The cover is not secured on the bottom. Be careful not to drop the cover.

**Important:** If you are installing more than one thermostat controller, keep track of which cover attaches to which base. The controller version and the base version must match to ensure proper operation.

**Important:** Use proper Electrostatic Discharge (ESD) precautions during installation and servicing to avoid damage to the electronic circuits of the thermostat controller.

3. Align the thermostat controller mounting base on the wall with the security screw on the top and use the base as a template to mark the two mounting hole locations. See Figure 3.

   **Notes:**
   - If you need to install the thermostat controller on an electrical junction box, use 2-1/2 x 4 in. (63 x 101 mm) square boxes with mud ring covers and avoid smaller 1-1/2 x 4 in. (38 x 101 mm) square or 3 x 2 in. (76 x 51 mm) boxes. This procedure ensures that you have enough space for cabling, if needed.
   - For surface-mounted applications, use durable mounting hardware, such as wall anchors, that cannot be easily pulled out of the mounting surface.

4. Pull approximately 6 in. (152 mm) of wire from the wall and insert the wire through the center hole in the thermostat controller mounting base. See Figure 3.

5. Secure the mounting base to the wall surface using two mounting screws (user supplied) as illustrated in Figure 3.

   **Note:** Be careful not to overtighten the mounting screws.

Figure 3: Mounting hole locations, dimensions, in. (mm) (left) and securing the thermostat controller mounting base to the wall (right)

**Note:** When the unit is mounted on the wall, you can hang the front cover on the end of the back cover as illustrated in Figure 4.
Wiring

When an existing thermostat controller is replaced, remove and label the wires to identify the terminal functions.

**CAUTION**

**Risk of Electric Shock**
Disconnect the power supply before making electrical connections to avoid electric shock.

**CAUTION**

**Risque de décharge électrique**
Débrancher l'alimentation avant de réaliser tout raccordement électrique afin d'éviter tout risque de décharge électrique.

**NOTICE**

**Risk of Property Damage**
Do not apply power to the system before checking all wiring connections. Short circuited or improperly connected wires may result in permanent damage to the equipment.

**NOTICE**

**Risque de dégâts matériels**
Ne pas mettre le système sous tension avant d'avoir vérifié tous les raccords de câblage. Des fils formant un court-circuit ou connectés de façon incorrecte risquent d'endommager irrémédiablement l'équipement.

**Important:** Make all wiring connections in accordance with local, national, and regional regulations. Do not exceed the electrical ratings of the TEC3000 Series Thermostat Controller.

**Important:** Use proper ESD precautions during installation and servicing to avoid damage to the electronic circuits of the thermostat controller.

To wire the thermostat controller:

1. Strip the ends of each wire 1/4 in. (6 mm) and connect them to the appropriate screw terminals as indicated in Table 2.
   - **Note:** For more details on wiring the MS/TP Communications Bus, refer to the **MS/TP Communications Bus Technical Bulletin (LIT-12011034).**

2. Attach the communication wires to the terminal block.
   - **Note:** If multiple wires are inserted into the terminals, be sure to properly twist the wires together before inserting them into the terminal connectors.

3. Carefully push any excess wire back into the wall.
   - **Note:** Seal the hole in the wall with fireproof material to prevent drafts from affecting the ambient temperature readings.

4. For networked models, set the bus end-of-line (EOL) termination switch to the desired location.

   The bus EOL termination switch allows you to designate the thermostat controller as the end of the Field Controller (FC) Bus and N2 Bus. The default position is OFF. If the thermostat controller is at the end of a daisy chain of devices on the FC Bus and N2 Bus, set the EOL switch to the ON position. See Figure 3.
5. Reattach the thermostat controller cover to the mounting base (bottom side first).

Important: Make sure you reattach the cover that corresponds to its correct base. The CPU board number needs to match the base board number. Otherwise, an operation error occurs after you reattach a cover and base that do not belong together.

6. Use a 1/16 in. (1.5 mm) Allen wrench or Johnson Controls T-4000-119 Allen-Head Adjustment Tool (order separately) to reinstall the security screw on the top of the thermostat controller cover. See Figure 2 for security screw placement.

7. Remove the protective plastic cover sheet from the display.

Important: If the display is dirty, gently wipe it clean with isopropyl alcohol or ethyl alcohol. Do not scrub hard as to avoid damaging the surface. Do not use other cleaners such as water, ketones, and aromatic solvents, since they may damage the polarizer.

Notes:
- For VAV and two-pipe systems, connect the valve to the heating output.
- Only one transformer is required for each TEC.
- Power to the AUX contact comes from the reheat coil.

Setup and adjustments

**Important:** Table 6 provides a full list of TEC3000 menu settings. Refer to TEC3000 Series Networked and Wireless On/Off or Floating Fan Coil and Individual Zone Thermostat Controllers with Dehumidification Capability Installation Instructions (LIT-12013161) for step-by-step instructions on how to access and adjust the more commonly used menus.

Overview

Figure 18 shows the thermostat controller home screen in both the light and dark themes in heating mode. You can customize it to show or hide various elements from the occupant. See Table 3 for a listing of the touchscreen icons. When screen customization is used in conjunction with a passcode, the building owner can control which options the occupant can access and adjust.

**Important:** If lockout levels are used, some icons are hidden. Table 4 provides details of these levels.
To switch between the modern, classic, light, and dark themes:

1. Press the **Menu** icon.
2. Press **Settings**.
3. Press **Display Settings**.
4. Press **Change Color Theme**.
5. Select one of the four options available.

Multiple pages are available on the display. The page that is currently being viewed is emphasized with a filled dot. The other available page is displayed as an empty dot.

In the modern theme, the cooling, or blue, and heating, or orange, circles show whether the cooling or heating mode is active.

### Customizing the home screen

To customize the Home screen:

1. Press the **Menu** icon.
2. Press **Display Settings**.
3. Enable or disable elements of the home screen as appropriate for the building owner and occupants.

4. Set the passcode on the thermostat controller to prevent the occupants from changing settings that they should not have access to change.

### Touchscreen icons

Table 3 describes the touchscreen icons on the home screen. Press and release a touchscreen icon to activate the TEC. Additional touchscreen icons appear based on the menu, and those icons are also described in Table 3.

User lockout

You can select from three different levels of access at the local display to manage functionality through the supervisory controller. This lockout is independent of any display or passcode settings. The existing temporary occupancy capability is unaffected by this feature. User lockout hides the icons that are not operable. The lockout levels are described in Table 4.

Using the USB port

The USB port allows you to quickly and easily load firmware upgrades, back up the current settings, and restore settings to the TEC3000 by using a USB drive. The TEC3000 can recognize eight configuration files or firmware package files. The USB drive format must be FAT or FAT32. The drive cannot be NTFS format or USB 3.0. If you are upgrading firmware or copying configuration files, you need the passcode if one has been set up. Do not remove the USB drive until the firmware upgrade is complete. The TEC3000 may restart and go offline to the NAE after a firmware upgrade. The upgrade takes approximately three minutes.

Configuring the thermostat controller

Use the Menu icon on the home screen to access and change the basic operating parameters of the thermostat controller. During normal operation, press the **Menu** icon once to access the following parameters:

- Fault Status
- Display Settings
- Status
- Setpoints
- Setup
- Update
- Schedule
- Trend

Installer configuration menu

The thermostat controller comes from the factory with default settings for all configuration parameters. Before any outputs turn on, the controller must be configured for the equipment connected. You need to start from the home screen to perform any of the following tasks.

Screen reset

The current screen returns to the home screen and turns off if the current screen is not touched for 3 minutes. Touch the screen to turn it on again. To disable the screensaving option, press **Display Settings** and set Enable Display Timeout to No.
Selecting the unit type

There are three unit types. They are:

- **Four-pipe**—This unit type has both heating and cooling coils plus a supply fan. This configuration can also be used on configurations that are heating or cooling only.
- **Two-pipe**—This unit type has a single set of pipes that can serve hot or chilled water plus a supply fan. The Supply Temp Type allows for the connection of an analog sensor or an aquastat to a binary input. Based on the water temperature or aquastat state, the unit controls heating or cooling.
- **VAV**—This unit type is designed for a pressure-dependent zone damper and the supply fan outputs are disabled. The TEC senses the supply air temperature coming from the unit. The Supply Temp Type setting allows for the connection of an analog sensor or binary duct thermostat. Based on the air temperature or duct thermostat state, the zone damper controls for heating or cooling. The TEC does not control the unit delivering the air. The logic needs to be part of another controller.

By default, the thermostat controller is configured for four-pipe fan coil mode.

Selecting the heating and cooling device type

By default, the thermostat is configured for On-Off (2-position) control. This can be changed to Floating (Incremental) mode when the Unit Type is not set to VAV. For VAV mode, only floating actuators are supported and this option is unavailable.

When in Floating mode, the Actuator Stroke Time must also be set to match the equipment.

Configuring the supply fan - fan coil only

On fan coil units (two-pipe or four-pipe), three different types of supply fans are supported. These are single-speed fans, multi-speed fans (up to three discrete speeds), and VSF using a 0 to 10 V control signal and an optional binary on/off command. Note that fan control is not available when in VAV mode.

For multi-speed fan control, you can adjust the point when the medium or high speed turns on. The fan speed is based on the load of the cooling/heating device, and is a percentage between 0 and 100. By default, the Med Speed On Cmd is 33% and the High Speed On Cmd is 66%. When only two fan speeds are used, you must set the High Speed On Cmd to 100% to disable the third speed.

For VSF control, the output is configurable for any range between 0 V and 10 V. The parameters are Start Voltage, Full Speed Voltage, and Minimum Command. Start Voltage is the voltage output at which the fan begins running, and Full Speed Voltage is the voltage output at which the fan reaches full speed. Minimum Command is the percentage of the range between the Start Voltage and the Full Speed Voltage. The fan does not go below the minimum command when the fan is turned on. By default, the Start Voltage is 2 V, the Full Speed Voltage is 10 V, and the Minimum Command is 20%.

When the variable speed fan is off, the FAN L binary output is off and the voltage at the VSF output is 0 V. When the fan turns on, the FAN L binary output turns on and the voltage at the VSF output begins controlling the fan. When the VSF is configured for reverse acting mode, when the Start Voltage is above Full Speed Voltage, the VSF output is set to 10 V or the Start Voltage minus 1 V, whichever value is the lesser, when the fan is turned off.

Setting the Control mode

The Control Mode informs the controller to run in Cooling only, Heating only, or Automatic mode, based on the temperature in the zone relative to the heating and cooling setpoints. Control Mode does not override equipment lockouts or changeover.

Setting the Fan mode - fan coil only

The Fan mode informs the controller how to handle the fan. There are two options for fan configuration: a Fan mode available to the installer through the menu system, and a fan override available as an option to the end user from the Fan icon on the home screen. See Customizing the home screen for information on enabling and disabling end-user controls. The Fan mode available to the installer is dependent on the fan type. The following options are provided for single- and variable-speed fans:

- **On**—Fan is continuously on
- **Auto**—Fan cycles on demand with the controller entering cooling, heating, or dehumidification modes
- **Smart**—Fan cycles on demand with the controller entering cooling or heating modes during unoccupied periods but is continuously running during occupied and standby periods

The Fan mode available to the installer is dependent on the fan type. The following options are provided for multi-speed fans:

- **Low**—Fan is continuously on low
- **Medium**—Fan is continuously on medium
- **High**—Fan is continuously on high
- **Auto**—Fan cycles on demand with the controller entering cooling, heating, or dehumidification modes
- **Smart**—Fan cycles on demand with the controller entering cooling or heating modes during unoccupied periods but is continuously running during occupied and standby periods

The Fan Override icon on the home screen is dependent on the fan type. The following options are provided for single- and variable-speed fans:

- **On**—Overrides the fan to be continuously on
- **Auto**—Follows the behavior set as Fan Mode
- **Quiet**—Follows the behavior set as Fan Mode, but prevents the fan from ever going above minimum speed. The Quiet option has no effect on equipment with single-speed fans.

The following Fan Override options are provided for multi-speed fans:

- **Low**—Fan is continuously on low
- **Medium**—Fan is continuously on medium
- **High**—Fan is continuously on high
- **Auto**—Follows the behavior set as Fan Mode
• Quiet—Follows the behavior set as Fan Mode, but prevents the fan from ever going above minimum speed

Configuring the zone space or equipment size - units configured with floating actuators, multi-speed fans, and variable-speed fans only

With non-binary outputs, the TEC3000 is configured by default to have a slower temperature response for larger zones with normal-sized equipment. In installations with small zones and oversized equipment, set the Equipment Size parameter to Oversized.

Changeover

Pressure-Dependent VAV systems and two-pipe fan coils require changeover detection in order to switch seasonal operation between heating and cooling modes. The TEC supports the following methods for changeover: automatic changeover using an analog sensor (thermistor), automatic changeover using a binary switch, or remote changeover from a BAS and manual changeover.

For automatic changeover, a supply temperature sensor or switch must be connected to the Changeover Sensor (COS) input of the TEC. Changeover Mode must be set to Auto, and Supply Temp Type must be set for Analog Sensor, Cooling N.C. (cooling when switch is closed), or Heating N.C. (heating when switch is closed). When an analog sensor is used, the changeover setpoint can be adjusted. The changeover logic applies a 10-degree Fahrenheit differential to the setpoint. The system switches to cooling mode when the temperature drops below the changeover setpoint and remains in cooling mode until the measured temperature has risen 10 degrees above the changeover setpoint.

You need to ensure that the Supply Temp type is set to Analog Sensor. The Changeover Mode is also exposed to the BAS through the CGOVR-MODE and can be commanded from the BAS.

On two-pipe or VAV systems without an automatic changeover, or on four-pipe systems, you can use RSEN or COS as a monitor-only point for reading an analog sensor. By setting the controller in four-pipe mode, or selecting Heating or Cooling for Changeover Mode, the controller defaults to monitor-only mode for RSEN or COS and exposes the value to the network as the supply temperature.

Dehumidification control - fan coil only

The TEC3000 controller support dehumidification control on fan coil devices under three configurations:
• Four-pipe fan coil
• Four-pipe fan coil with reheat
• Two-pipe fan coil (with changeover in cooling mode) with reheat

For optimal dehumidification performance, a 4-pipe unit with floating/incremental or 0 to 10 V control and a multi-speed or variable-speed fan is recommended.

Dehumidification operates when the zone humidity increases above the zone humidity setpoint and the controller is in the Idle or Cooling state. Dehumidification does not operate during heating and stops if the zone temperature drops below the heating setpoint. When dehumidification is active, the cooling device controls to the humidity setpoint, and the heating device reheats the zone in order to keep the temperature at the cooling setpoint. While in the dehumidification mode, a multi-speed or variable-speed fan runs at the lowest possible speed to maximize condensation and moisture removal across the cooling coil.

Temperature setpoints

The thermostat controller provides a flexible setpoint configuration to give power to the building owner while being easy to use by the occupant. In addition to a simple up/down offset adjustment on the home screen for the occupant, there are six temperature setpoints on the TEC. The six temperature setpoints are Cooling and Heating setpoints for Occupied, Unoccupied, and Standby modes.

Note: The TEC enforces a 2-degree deadband between heating and cooling setpoints. If a setpoint violates this standard (for example, cooling setpoint is set to 70 with a heating setpoint already set to 70), the opposing setpoint is modified to comply with this deadband (in the previous example, the heating setpoint would automatically change to 68).

The four modes of setpoint operation are described in Table 5.

<table>
<thead>
<tr>
<th>Mode of setpoint operation</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Occupancy Select = Setpoint Offset and Heat Cool Setpoint Mode = Individual Setpoints</td>
<td>This is the default mode and the original mode of operation that the TEC was released with (the next three modes are new). In this mode, the TEC has a heating setpoint and a cooling setpoint. There is a common Setpoint Offset (warmer/cooler adjust) that is applied to each setpoint simultaneously. The range of setpoint adjustment is two-fold: • There are large constant ranges bounding the individual heating and cooling setpoints. • There is also a smaller configurable range limit set to the Setpoint Offset point (Control Setup &gt; General &gt; Max Setpoint Offset).</td>

<tr>
<td>Occ Setpoint Select = Min and Max Setpoints and Heat Cool Setpoint Mode = Individual Setpoints</td>
<td>In this mode, the TEC has a heating setpoint and a cooling setpoint. Each setpoint has a configurable range (Setpoints &gt; Min Cooling Setpoint, Max Cooling Setpoint, Min Heating Setpoint, and Max Heating Setpoint). The configurable range values are bounded by the larger constant bounds used in Setpoint Offset mode and are constrained in the following manner: Min must be below Max and Heating must be below Cooling, so in order from least to greatest, the values are: Min Heating Setpoint, Max Heating Setpoint, Min Cooling Setpoint, and Max Cooling Setpoint.</td>
</tr>
<tr>
<td>Occ Setpoint Select = Setpoint Offset and Heat Cool Setpoint Mode = Common Setpoint</td>
<td>In this mode, the TEC has one setpoint, Common Setpoint, for heating and cooling. There is also a common Setpoint Offset (warmer/cooler adjust) that is only applied to Common Setpoint. Otherwise, this setting works the same as when Occ Setpoint Select = Setpoint Offset and Heat Cool Setpoint Mode = Individual Setpoints.</td>

Important: Internally, the TEC3000 uses a BACnet schedule where daily schedules are independent of the previous and next days. The default occupancy of the TEC3000 from the factory is set to Occupied. As a result, a daily event at 12:00 AM must be scheduled if you do not want the controller to transition to Occupied Mode at midnight.

Overriding the occupancy mode

The TEC supports a manual override of all other schedule sources (for example, Schedule, Occupancy BI, and temporary occupancy).

Enabling optimal start

The TEC supports an advanced optimal start algorithm. The algorithm works in conjunction with a local schedule to pre-heat or pre-cool the zone before scheduled occupancy periods begin, in order to bring the zone to the desired occupied setpoint when the scheduled occupancy period begins. Occupant comfort is ensured while automatically minimizing energy usage. This algorithm creates a model of the zone being controlled and automatically determines when to start the equipment before the scheduled transition to Occupied. The start time automatically adjusts daily to minimize the time between reaching setpoint and entering Occupied state.

Note: Optimal Start does not work when the schedule source is set to External.

Enabling the motion sensor (TEC3xx3 Models)

By default on models with integral motion sensing capability, the motion sensor is enabled with a default timeout of 15 minutes from the last detection of motion in the zone. On models without an integrated sensor, the default timeout is still 15 minutes, but it only is applied when one of the two configurable binary inputs is set to be a motion sensor (see Configurable Binary Inputs for information on configuring the binary inputs). To disable motion sensing capabilities, set the Motion Sensor Timeout to 0 minutes.

Scheduling (for all models)

The occupancy schedule comes from either the weekly scheduler built into the TEC or as an input from the BAS. The Schedule Source must be selected to tell the controller where to read the occupancy source from.

Setting the local schedule

A weekly occupancy schedule with up to four occupancy events for each day can be set locally on the TEC and operate independently of a supervisor. See Scheduling (for all models) to ensure the schedule source is set to Local.

2. Edit the backup file created in the previous step on a PC to reflect the desired settings.  
3. Verify that the modified values are within minimum and maximum range in the backup file.  
4. Restore the settings from the newly edited backup file on the TEC. |
| The temperature displayed is lower than the actual room temperature.    | Cold air drafts are entering the back of the TEC.  
Air is being forced through the TEC from a nearby vent. | Seal any holes behind the TEC to reduce drafts.  
Move the location of the TEC or change the venting to prevent air from being forced through the TEC. |
| For networked models, the Online icon does not appear for a networked controller. | There is improper field bus wiring. | Refer to the MS/TP Communications Bus Technical Bulletin (LIT-12011034). |
| For wireless models, Supervisory Status = Offline                      | The supervisory controller is not communicating with the TEC.  
The TEC is not mapped to a JCI Supervisory System.  
The WNC Gateway is not communicating with the TEC. | 1. Map the TEC into a JCI Supervisory system.  
2. Verify that the PAN’s WNC Gateway is online.  
3. Add ZFR Pro Routers/Repeaters into the wireless system. |
